

The Family of *Information Functions*

These `info_*`() functions present us with **gt** tables containing useful information. So far, we can get reference information on date styles (`info_date_style()`), on time styles (`info_time_style()`), on a huge number of color palettes (`info_paletteer()`), and, on currencies (`info_currencies()`).

`info_date_style()` : View a table with info on date styles

The `fmt_date()` function lets us format date-based values in a convenient manner using preset styles. The table generated by the `info_date_style()` function provides a quick reference to all 14 styles, with associated number codes, the format names, and example outputs using a fixed date (`2000-02-29`).

EXAMPLE

Get a table of info on the different date-formatting styles (which are used by supplying a number code to the `fmt_date()` function).

```
info_date_style()
```

Preset Date Formats

Usable in the `fmt_date()` and `fmt_datetime()` functions

Date Formats		
Number	Name	Formatted Date
1	iso	2000-02-29
2	wday_month_day_year	Tuesday, February 29, 2000
3	wd_m_day_year	Tue, Feb 29, 2000
4	wday_day_month_year	Tuesday 29 February 2000
5	month_day_year	February 29, 2000
6	m_day_year	Feb 29, 2000
7	day_m_year	29 Feb 2000
8	day_month_year	29 February 2000
9	day_month	29 February
10	year	2000
11	month	February
12	day	29
13	year.mn.day	2000/02/29

Preset Date Formats

Usable in the `fmt_date()` and `fmt_datetime()` functions

14 y.mn.day

00/02/29

`info_time_style()`: View a table with info on time styles

The `fmt_time()` function lets us format time-based values in a convenient manner using preset styles. The table generated by the `info_time_style()` function provides a quick reference to all five styles, with associated number codes, the format names, and example outputs using a fixed time (14:35).

EXAMPLE

Get a table of info on the different time-formatting styles (which are used by supplying a number code to the `fmt_time()` function).

```
info_time_style()
```

Preset Time Formats

Usable in the `fmt_time()` and `fmt_datetime()` functions

Time Formats		
Number	Name	Formatted Time
1	hms	14:35:00
2	hm	14:35
3	hms_p	2:35:00 PM
4	hm_p	2:35 PM
5	h_p	2 PM

`info_currencies()`: View a table with info on supported currencies

The `fmt_currency()` function lets us format numeric values as currencies. The table generated by the `info_currencies()` function provides a quick reference to all the available currencies. The currency identifiers are provided (name, 3-letter currency code, and 3-digit currency code) along with the each currency's exponent value (number of digits of the currency subunits). A formatted example is provided (based on the value of 49.95) to demonstrate the default formatting of each currency.

EXAMPLES

Get a table of info on all of the currencies where the three-letter code begins with a "h".

```
info_currencies(begins_with = "h")
```

Currencies Supported in gt

Currency codes are used in the `fmt_currency()` function

Identifiers				
Currency Name	Currency Code	Currency Number	Exp	Formatted Currency
Hong Kong dollar	HKD	344	2	HK\$49.95
Honduran lempira	HNL	340	2	L49.95
Croatian kuna	HRK	191	2	kn49.95
Haitian gourde	HTG	332	2	G49.95
Hungarian forint	HUF	348	2	Ft49.95

Get a table of info on all of the common currency name/symbols that can be used with `fmt_currency()` .

```
info_currencies(type = "symbol")
```

Currencies Supported in gt	
Currency symbols are used in the <code>fmt_currency()</code> function	
Currency Symbol	Formatted Currency
dollar	\$49.95
euro	€49.95
pound	£49.95
yen	¥49.95
franc	F49.95
lira	₺49.95
peseta	₧49.95
won	₩49.95
sheqel	₪49.95
dong	₫49.95
kip	₭49.95
tugrik	₮49.95

Currencies Supported in **gt**

Currency symbols are used in the `fmt_currency()` function

drachma	₯49.95
peso	₱49.95
guarani	₲49.95
austral	₡49.95
hryvnia	₴49.95
cedi	₷49.95
rupee	₹49.95
generic	₣49.95

`info_locales()`: View a table with info on supported locales

Many of the `fmt_*`() functions have a locale argument that makes locale-based formatting easier. The table generated by the `info_locales()` function provides a quick reference to all the available locales. The locale identifiers are provided (base locale ID, common display name) along with the each locale's group and decimal separator marks. A formatted numeric example is provided (based on the value of 11027) to demonstrate the default formatting of each locale.

EXAMPLE

Get a table of info on all of the locales where the base locale ID begins with a "v".

```
info_locales(begins_with = "v")
```

Locales Supported in **gt**

Locale codes are used in several `fmt_*`() functions

Locale	Separators		Formatted Value
	Group	Decimal	
vai_Latn_LR Vai (Latin, Liberia)	,	▪	11,027.00
vai_Latn Vai (Latin)	,	▪	11,027.00
vai_Vaii_LR Vai (Vai, Liberia)	,	▪	11,027.00
vai_Vaii Vai (Vai)	,	▪	11,027.00

Locales Supported in **gt**

Locale codes are used in several `fmt_*()` functions

vai			
Vai	,	▪	11,027.00
vi_VN			
Vietnamese (Vietnam)	▪	,	11.027,00
vi			
Vietnamese	▪	,	11.027,00
vun_TZ			
Vunjo (Tanzania)	,	▪	11,027.00
vun			
Vunjo	,	▪	11,027.00

`info_paletteer()`: View a table with info on color palettes

While the `data_color()` function allows us to flexibly color data cells in our **gt** table, the harder part of this process is discovering and choosing color palettes that are suitable for the table output. We can make this process much easier in two ways: (1) by using the **paletteer** package, which makes a wide range of palettes from various R packages readily available, and (2) calling the `info_paletteer()` function to give us an information table that serves as a quick reference for all of the discrete color palettes available in **paletteer**.

EXAMPLE

Get a table of info on just the `ggthemes` color palette (easily accessible from the **paletteer** pkg).

```
info_paletteer(color_pkgs = "ggthemes")
```

Palettes Made Easily Available with **paletteer**

Palettes like these are useful with the `data_color()` function

Package and Palette Name		Color Count and Palette
ggthemes		
calc	12	
manyeyes	19	
gdoc	10	

The **paletteer** package is maintained by Emil Hvitfeldt. More information can be found on the **paletteer** site (<https://emilhvitfeldt.github.io/paletteer/>) and on the **CRAN** info page (<https://cran.r-project.org/web/packages/paletteer/index.html>).

Palettes Made Easily Available with **paletteer**

`info_google_fonts()` : View a table on recommended Google Fonts

The `google_font()` helper function can be used wherever a font name should be specified. There are two instances where this helper can be used: the `name` argument in `opt_table_font()` (for setting a table font) and in that of `cell_text()` (used with `tab_style()`). Because there is an overwhelming number of fonts available in the *Google Fonts* catalog, the `info_google_fonts()` provides a table with a set of helpful font recommendations. These fonts look great in the different parts of a **gt** table. Why? For the most part they are suitable for body text, having large counters, large x-height, reasonably low contrast, and open apertures. These font features all make for high legibility at smaller sizes.

EXAMPLE

Get a table of info on some of the recommended *Google Fonts* for tables.

```
info_google_fonts()
```
